Introduction

Medicaid helps people live healthier and more economically secure lives. It increases the diagnosis and early treatment of chronic conditions, enhances educational achievement and future earnings for covered children, reduces health care inequities, and provides comprehensive, high-quality, and cost-effective care. Medicaid coverage is tailored to the unique needs of individuals and families with low incomes but still costs less per beneficiary than private insurance. Medicaid’s core beneficiary protections make the program work for enrolled populations, including children, parents, pregnant people, low-income workers, older adults, and people with disabilities. Despite Medicaid’s proven success and efficient use of funds, detractors repeatedly seek to cut or cap funding for the program. These proposals seriously jeopardize the health and financial security of the 91.8 million people who benefit from Medicaid and CHIP.

This fact sheet explains why Medicaid is critical to preventing and treating substance use disorders (SUD), including opioid use disorders (OUD), and examines how these efforts would be harmed by Medicaid funding caps.

Why Medicaid is Important for People with and at Risk for SUD

Medicaid plays an important role in preventing SUD. Early interventions to identify and prevent SUD save money and lives. Access to timely, evidence-based health services can prevent SUD by ensuring that problems are identified and treated early, reducing the need for opioid-based therapy down the road. Under Medicaid’s Early and Periodic Screening, Diagnostic, and Treatment (EPSDT) benefit, individuals under age twenty-one enrolled in Medicaid must be provided with periodic mental health assessments and substance use screenings. In many cases, these screenings, which are instrumental in identifying individuals
at risk of SUD and connecting them with appropriate medical and behavioral interventions, are also covered for adults.\textsuperscript{6}

**Medicaid is the largest source of health insurance coverage for individuals with SUD.** The number of Americans lost to overdose is at record levels.\textsuperscript{7} Reducing the number of these preventable deaths requires ensuring that people with SUD have access to evidence-based treatment, including medications for opioid use disorders (MOUD). Medicaid is the single largest source of coverage for behavioral health services, including SUD treatment.\textsuperscript{8} While SUD affects people at many income levels, it may be particularly prevalent among Americans with low incomes.\textsuperscript{9} Of the 34.7 million adults in the U.S. with a SUD, twenty-one percent are covered by Medicaid, many of whom qualify for Medicaid based on disability or through Medicaid expansion.\textsuperscript{10}

**Medicaid provides comprehensive coverage of SUD treatment and overdose prevention services.** Medicaid coverage of mental health and SUD services is generally more comprehensive than private coverage.\textsuperscript{11} Pursuant to federal law, Medicaid programs in all states and territories cover all three FDA-approved medications for OUD.\textsuperscript{12} While this requirement is time-limited, most states are likely to maintain coverage levels that far exceed those offered by private plans. Medicaid expansion has also led to an increase in the availability of SUD treatment providers, particularly in rural and underserved areas that have been particularly affected by the overdose epidemic.\textsuperscript{13}

**How Medicaid Funding Caps will Harm People with and at Risk for SUD**

**Funding caps would limit access to prevention and treatment of SUD.** Medicaid is the largest source of funding for SUD services.\textsuperscript{14} Capping Medicaid’s federal funding would severely impact SUD prevention and treatment services, with much of the impact falling disproportionately on individuals in states hardest hit by the overdose epidemic. For example, Kentucky, Maine, New Mexico, Ohio, and West Virginia have some of the highest rates of SUD in the country and have all significantly benefited from Medicaid expansion, with the program covering over nineteen percent of the population in each of those states.\textsuperscript{15}

**Funding caps would lead states to impose onerous requirements for beneficiaries to access SUD services.** To reduce Medicaid spending, states would likely impose burdensome restrictions on beneficiaries’ access to SUD prevention and treatment, including prior authorization and quantity limits for MOUD coverage. Loss of preventive care would also likely lead to higher SUD incidence. Taken together, this loss of funding for SUD prevention and treatment services will result in higher health care costs and preventable suffering, injury, and death.
Funding caps would reduce the effectiveness of the parity requirement. Under the ACA’s mental health parity requirement, Medicaid programs are generally prohibited from imposing financial requirements and treatment limitations on SUD treatment benefits that are more restrictive than those on medical and surgical benefits. However, if coverage of medical and surgical benefits is reduced, states will also be free to reduce the array of SUD services currently covered.

WEEKLY REPORT 26, 719-725 (2015), https://www.cdc.gov/mmwr/preview/mmwrhtml/mm6426a3.htm (Average annual rates of past-year heroin use highest among individuals with household income below $20,000/year).

13 See Maria X. Sanmartín et al., *Trends in Buprenorphine-Waivered Providers in Medicaid Expansion and Non-Expansion States by Their Public Listing Status*, 43 SUBSTANCE ABUSE 1072 (2022), https://www.tandfonline.com/doi/abs/10.1080/08897077.2022.2060428. While the elimination of the requirement for providers to obtain a waiver to prescribe buprenorphine in the Consolidated Appropriations Act of 2023 will lead to increased treatment availability in all states, this study shows that expansion states already have the infrastructure in place to enable providers to engage in SUD treatment.
